

The Hospitality Guild — Launch Setup Guide

Complete deployment checklist: Neon · Google OAuth · Stripe · Vercel

Step 1 — Neon Database (PostgreSQL)

1. Go to **neon.tech** and create a free account
2. Click **New Project** — name it `hospitality-guild`, select US East region
3. Click **Connection Details** and copy the **Connection String**:

```
postgresql://user:pass@ep-xxx.us-east-2.aws.neon.tech/neondb?sslmode=require
```

4. Save as `DATABASE_URL` — needed in Step 4

The free Neon tier gives you 0.5 GB storage and 191 compute hours/month — plenty to start. Upgrade later as needed.

Step 2 — Google OAuth Credentials

1. Go to **console.cloud.google.com** — create a new project named `hospitality-guild`
2. Navigate to **APIs & Services** → **OAuth consent screen**
 - User type: **External**
 - App name: `The Hospitality Guild`
 - Fill in email fields, click Save and Continue through all steps
3. Navigate to **APIs & Services** → **Credentials** → **Create Credentials** → **OAuth 2.0 Client ID**
 - Application type: **Web application**
 - Name: `Guild Website`
 - Under **Authorized redirect URIs**, add:

```
https://thehospitalityguild.com/api/auth/callback/google
```

4. Click **Create** — copy these two values:

VARIABLE

WHERE TO FIND IT

GOOGLE_CLIENT_ID

"Your Client ID" field

GOOGLE_CLIENT_SECRET

"Your Client Secret" field

After deploying to Vercel (Step 4), also add your `.vercel.app` preview URL as a second authorized redirect URI.

Step 3 — Stripe Products & Prices

Go to dashboard.stripe.com → **Products** → **Add product** and create three products:

Product 1: Guild Member

FIELD	VALUE
Name	Guild Member
Price	\$29.00 / Monthly

Copy the **Price ID** (starts `price_`) → save as `STRIPE_MEMBER_PRICE_ID`

Product 2: Guild Business — Base

FIELD	VALUE
Name	Guild Business — Base
Price	\$99.00 / Monthly

Copy the **Price ID** → save as `STRIPE_BUSINESS_BASE_PRICE_ID`

Product 3: Guild Business — Seat

FIELD	VALUE
Name	Guild Business — Seat
Price	\$0.00 / Monthly

Copy the **Price ID** → save as `STRIPE_BUSINESS_SEAT_PRICE_ID`

Why a \$0 seat? The full \$99 is on the base product. The seat product lets each business subscription carry 4 seat

line items in Stripe for programmatic seat tracking.

Finally: go to **Settings** → **Customer portal** and enable it — required for the "Manage Billing" button.

Step 4 — Deploy to Vercel

1. Go to **vercel.com** → **Add New Project** → **Import Git Repository**
2. Select `bobprestenbach/guild-website`, branch `claude/hospitality-guild-site-pubqfs`
3. Framework preset: **Next.js** (auto-detected)
4. Open **Environment Variables** and add all of the following before deploying:

```
DATABASE_URL           = postgresql://... (from Step 1)
AUTH_SECRET             = <run: openssl rand -base64 32>
GOOGLE_CLIENT_ID        = ... (from Step 2)
GOOGLE_CLIENT_SECRET    = ... (from Step 2)
STRIPE_SECRET_KEY       = sk_live_... (Stripe → Developers → API keys)
STRIPE_WEBHOOK_SECRET   = whsec_... (add after Step 5)
STRIPE_MEMBER_PRICE_ID  = price_... (from Step 3)
STRIPE_BUSINESS_BASE_PRICE_ID = price_... (from Step 3)
STRIPE_BUSINESS_SEAT_PRICE_ID = price_... (from Step 3)
NEXT_PUBLIC_APP_URL     = https://thehospitalityguild.com
```

Generate `AUTH_SECRET` in your terminal:

```
openssl rand -base64 32
```

5. Click **Deploy** — Vercel will build and provide a `.vercel.app` preview URL

Step 5 — Stripe Webhook

1. Go to **Stripe** → **Developers** → **Webhooks** → **Add endpoint**
2. Endpoint URL: `https://thehospitalityguild.com/api/stripe/webhook`
3. Select these four events:
 - `checkout.session.completed`
 - `invoice.payment_succeeded`
 - `customer.subscription.updated`
 - `customer.subscription.deleted`

4. Click **Add endpoint** → click **Reveal** under Signing secret → copy the `whsec_...` value
5. Add `STRIPE_WEBHOOK_SECRET` to Vercel env vars, then **Redeploy**

Step 6 — Initialize the Database Schema

After Vercel deploys successfully, run this **once** to create all database tables:

```
npx prisma db push
```

If running locally without a `.env.local`, use Vercel CLI:

```
npm install -g vercel
vercel login
vercel env pull .env.local
npx prisma db push
```

Expected output:

- ```
✓ Generated Prisma Client
✓ Your database is now in sync with your schema.
```

---

## Step 7 — GoDaddy DNS

---

1. Log in to **GoDaddy.com** → **My Products** → **DNS** for `thehospitalityguild.com`
2. Add or update these two records:

| TYPE  | NAME | VALUE                | TTL  |
|-------|------|----------------------|------|
| A     | @    | 76.76.21.21          | 600  |
| CNAME | www  | cname.vercel-dns.com | 3600 |

3. In **Vercel** → **Project** → **Settings** → **Domains**, add `thehospitalityguild.com`
  4. Vercel will verify DNS and auto-provision SSL — typically takes 5–30 minutes
-

## Final Checklist

---

- ☐ Neon database created and connection string saved
  - ☐ Google OAuth credentials created with correct redirect URIs
  - ☐ Three Stripe products/prices created and Price IDs saved
  - ☐ Stripe customer portal enabled
  - ☐ Vercel deployment live with all 10 environment variables set
  - ☐ Stripe webhook configured with 4 events and signing secret added to Vercel
  - ☐ Database schema initialized via `prisma db push`
  - ☐ GoDaddy DNS: A record + CNAME added
  - ☐ Domain added in Vercel and SSL certificate issued
  - ☐ Test sign-in with Google — confirm EXPLORER tier shows in dashboard
  - ☐ Test Stripe payment in test mode before going live
-
